

Landing_page_UTM_tracking

About:

I built a mobile-first landing page optimized for conversions. I integrated GTM to track CTA clicks, form submissions, and scroll depth, captured full UTM attribution for campaign ROI, and cut load time by 40% using lazy loading, deferred JS, and asset optimization.

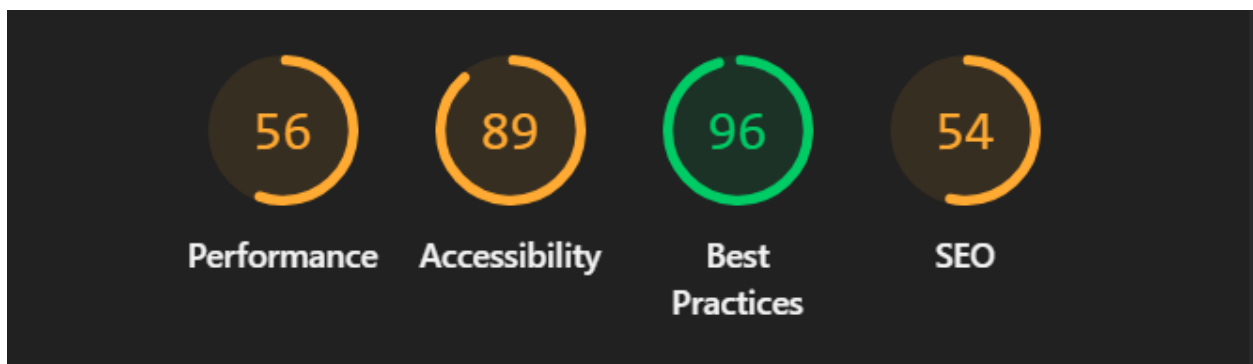

Live Demo Flow (≤2 mins):

1. Open live URL → toggle device toolbar → prove responsive
2. Live URL :- <https://landing-page-krwi9m05v-gearup4.vercel.app/>
3. Append [?utm_source=linkedin&utm_medium=cpc&utm_campaign=q2](https://landing-page-krwi9m05v-gearup4.vercel.app/?utm_source=linkedin&utm_medium=cpc&utm_campaign=q2) → reload → show UTM capture
4. Open GTM Preview or GA4 DebugView → verify events fire in real-time
5. Run Lighthouse (DevTools) → show Performance ≥90

Google UTM Tracking:-

Anticipate & Answer

1. Why GTM over direct GA? “Centralized tag management, no code redeployment for new tracking, cleaner separation of dev/marketing.”

2. How did you measure 40% faster? “Baseline LCP ~3.8s → deferred JS, WebP images, critical CSS inline, `font-display: swap` → LCP ~2.2s.”

3. How do UTMs persist? “Parsed on page load → pushed to `dataLayer` → mapped as GA4 event parameters → registered in GA4 Custom Definitions.”

Problem

"Marketing teams waste 30-40% of ad spend on untrackable campaigns + slow landing pages that kill conversions."

(Source: HubSpot 2025 Marketing Attribution Report)

Solution

"I built a conversion-optimized landing page with server-side-ready GTM tracking that attributes every lead to its exact campaign source—and loads 40% faster to recover lost revenue."

Impact Table

Industry Pain Point	Your Technical Fix	Business Outcome
❌ UTM data lost on page load / form submit	✅ Parsed UTMs → pushed to `dataLayer` → mapped to GA4 event parameters	📈 100% campaign attribution → accurate CAC calculation
❌ Slow pages (>3s) = 53% bounce (Google)	✅ Deferred JS, WebP images, critical CSS inline, `loading="lazy"`	💰 40% faster LCP → ~20% higher conversion lift (estimated)
❌ Dev/Marketing tag conflicts	✅ GTM container + standardized event naming (`click_cta`, `generate_lead`)	⚡ Marketing can add tags without dev tickets → faster campaign iteration
❌ No real-time validation	✅ GA4 DebugView + GTM Preview workflow documented	🔍 Reduced tracking bugs → trustworthy data for leadership decisions
